

FlowSync – Slack Integration Guide

1. Overview

This document describes the official Slack integration for FlowSync, a B2B SaaS productivity platform. It covers authentication (OAuth), reconnect procedures, and required permission scopes.

The integration enables teams to receive notifications, manage tasks, and collaborate directly from Slack.

2. Integration Capabilities

FlowSync + Slack integration supports:

- Task notifications in Slack channels
 - Direct message alerts for assignments
 - Status updates on projects
 - Command-based actions (slash commands)
 - Real-time alerts for system events
-

3. OAuth Authentication Flow

3.1 Standard OAuth Process

1. User clicks "Connect Slack" in FlowSync
 2. Redirected to Slack OAuth authorization page
 3. User selects workspace and grants permissions
 4. Slack returns authorization code
 5. FlowSync exchanges code for access token
 6. Integration is activated
-

3.2 Common OAuth Issues

Issue 1: Invalid OAuth Code

- Cause: Expired or reused authorization code
- Resolution: Restart OAuth flow from FlowSync settings page

Issue 2: Redirect URI Mismatch

- Cause: Misconfigured Slack app settings
- Resolution: Ensure redirect URI matches FlowSync configuration exactly

Issue 3: Access Denied by User

- Cause: User declined permission request
- Resolution: Ask user to re-authorize integration

Issue 4: Workspace Not Found

- Cause: Slack workspace mismatch
 - Resolution: Verify correct workspace selection during OAuth
-

4. Reconnect / Reauthorization Steps

If Slack integration stops working or becomes inactive:

4.1 Manual Reconnect Process

1. Navigate to FlowSync Settings → Integrations
 2. Select Slack Integration
 3. Click "Reconnect Slack"
 4. User is redirected to Slack OAuth page
 5. Re-authorize permissions
 6. Integration is restored
-

4.2 Automatic Token Expiry Handling

- Access tokens may expire or be revoked
 - FlowSync detects invalid token during API calls
 - System triggers reconnect notification to user
-

4.3 Reconnect Failure Handling

If reconnection fails:

- Check Slack API status
 - Validate app credentials
 - Clear cached tokens and retry OAuth flow
-

5. Permission Scopes

FlowSync requires the following Slack OAuth scopes:

5.1 Basic Scopes

- `chat:write` → Send messages to channels
- `channels:read` → Read public channel information
- `groups:read` → Access private channels (if authorized)
- `users:read` → Fetch user details

5.2 Event Scopes

- `channels:history` → Read messages in channels
- `im:history` → Read direct messages

5.3 App Functionality Scopes

- `commands` → Enable slash commands
 - `incoming-webhook` → Send notifications via webhook
-

6. Security Considerations

- Tokens are encrypted at rest
 - OAuth credentials are never exposed to frontend
 - Access is restricted by workspace-level authorization
 - Logs are maintained for audit purposes
-

7. Troubleshooting Summary

Problem	Cause	Solution
OAuth failure	Invalid code	Restart OAuth flow
Integration inactive	Token expired	Reconnect Slack
Missing permissions	Scope not granted	Reauthorize app

8. AI System Usage (Agentic Integration)

This document is used by AI agents to:

- Diagnose Slack integration failures
 - Suggest OAuth reauthorization steps
 - Validate permission scope issues
 - Trigger reconnect workflows
 - Generate support tickets for integration errors
